Introduction

Samples 15285 – 15288 (and 15268) were all collected from the rim of a small crater at station 6 and returned in the same bag. They are breccia fragments from the same location as 15265 (Swann et al. 1972).

Petrography

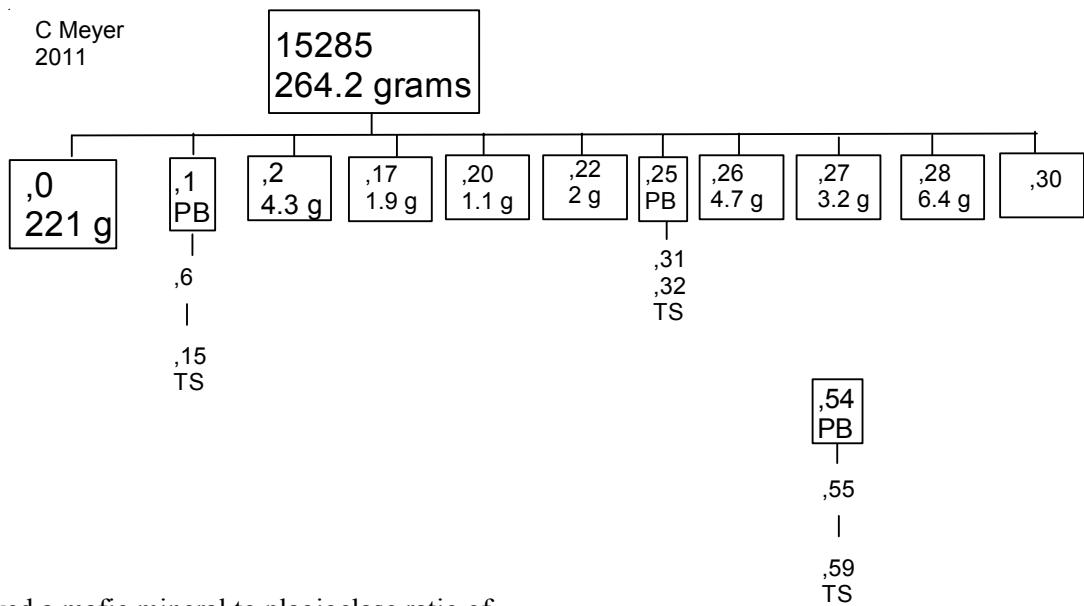

Von Engelhardt et al. (1973) found 15285 to consist of all components of the soils in a fragmental, perhaps partly glassy matrix and contains, besides ophitic and intersertal basalts, plagioclase breccias, troctolites, noritic fragments, glass and individual mineral grains.

Table 1. Chemical composition of 15285.

C Meyer
2011

They observed a mafic mineral to plagioclase ratio of 1:2.

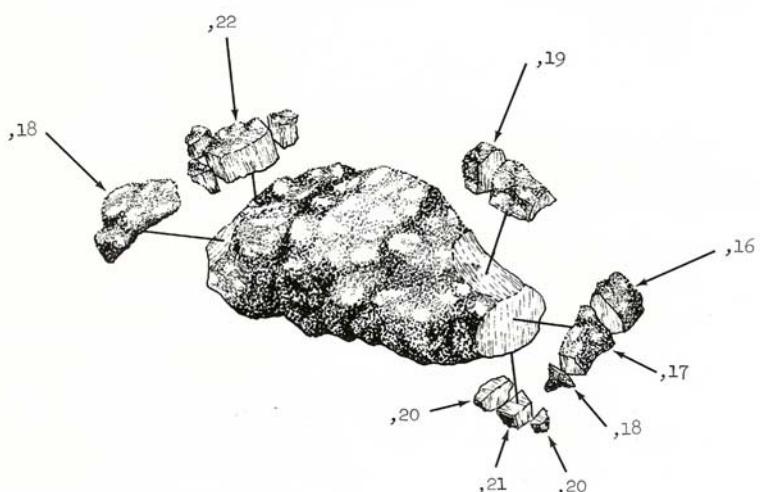

Figure 1 shows this breccia fragment to have a region of frothy, vesicular glass and figure 4 shows a seriate grain size distribution.

Chemistry

O'Kelley et al. (1972), Taylor et al. (1973), Christian et al (1976), Gros et al. (1976) and Hughes et al. (1973) reported the chemical composition (figures 5 and 6).

Processing

15285, 15286, 15287, 15288, 15289 and also 15268 were returned together in documented bag 192 and may be pieces of the same material.
